The Portfolio: An Exercise in Exploring Artificial Intelligence

NoteMates: Your Study Buddy for Your Notes
Part 1 (Draft)

The scenario

Imagine you're two weeks away from your AWS Cloud Practitioner exam. Over the past few months you've collected notes from video lessons, the AWS documentation, and practice quizzes, and they're now spread across several documents. While revising, you can't remember the difference between S3 Standard and S3 Glacier. You know you wrote it down somewhere, but 20 minutes of scrolling and rereading later, you still haven't found it, and your study time is slipping away.

What if you could simply ask your notes the question and get a clear answer in seconds?

That's the idea behind NoteMates: a study notes chatbot, built in Amazon PartyRock, that turns a pile of notes into something you can talk to.

Who is the Customer?

Students studying for the AWS Cloud Practitioner certification, who collect notes from lessons, videos, and documentation.

Who is affected?

The students themselves, plus study groups and tutors who answer the same "where did we cover this?" questions repeatedly.

The customer problem/opportunity

Study notes pile up across documents and pages. When a student needs a quick answer, such as the difference between S3 storage classes, they spend time scrolling and rereading instead of learning. There's an opportunity to make notes something you can talk to rather than search through.

Proposed solution to launch

NoteMates, a study notes chatbot built in Amazon PartyRock. The student adds their notes, then asks questions in plain English and gets answers based on their own material.

Why the customer needs it in their life?

It saves time, makes revision more interactive, and keeps answers tied to the student's own notes instead of generic internet answers, which fits the way they actually learn. It also supports active recall, since students can ask the bot to explain a topic simply or test their understanding.

How it works:

1. The student pastes or uploads their study notes into NoteMates.
2. They type a question, such as "When would I use Amazon EC2 instead of Lambda?"
3. A generative AI model (running on Amazon Bedrock behind PartyRock) reads the notes and the question.
4. The chatbot replies in clear language, drawing on the notes, so the student gets an answer without hunting for it.
