The Portfolio - PartyRock: Test your Ideas

NoteMates: Your Study Buddy for Your Notes
Part 3 (Draft): Initial App Build

Where I am now

I have built a working version of NoteMates in Amazon PartyRock with a notes input, a study chatbot and a quiz generator. Flashcards and summaries are still being refined.

What I built

NoteMates is a PartyRock app made of these widgets:

Widget	Type	Purpose
Study Notes	[Document upload / text input]	[Where notes are added]
NoteMates Chat	[Chatbot]	[Answers questions from the notes]
Quiz Generator	[Text generation]	[Creates practice questions]
Flashcards	[Text generation]	[Pulls out key terms]
Topic Summary	[Text generation]	[Condenses sections]

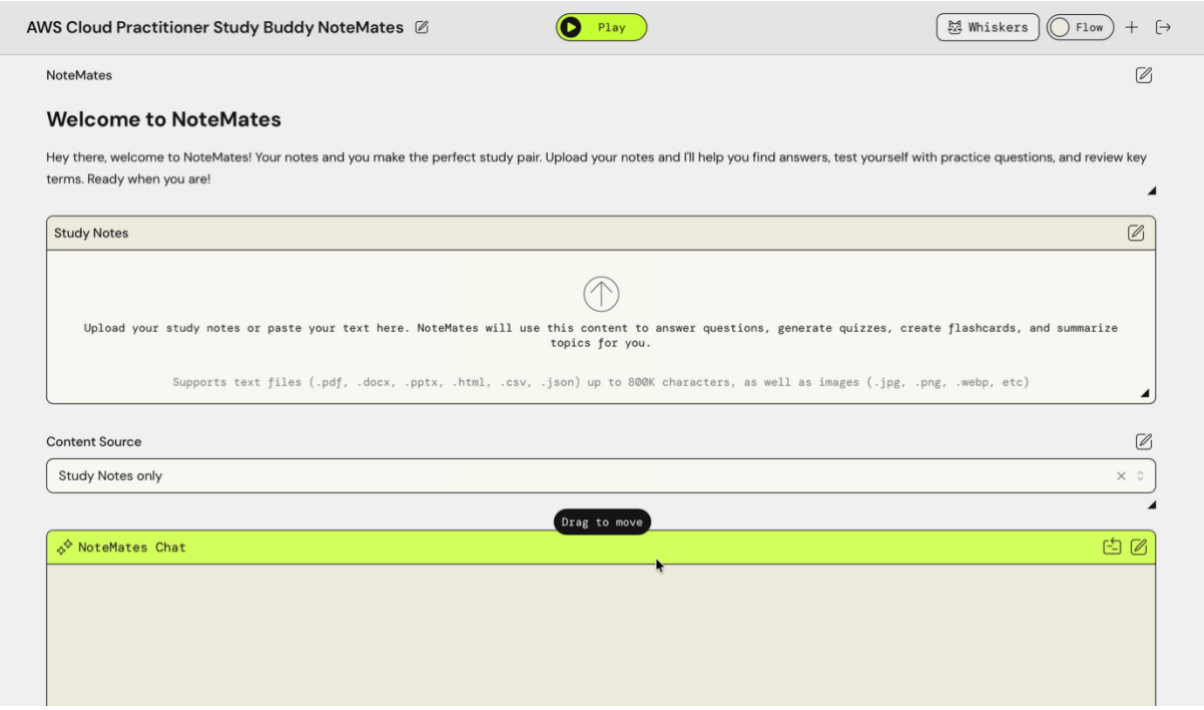

Figure 1: The NoteMates app in Amazon PartyRock.

How I built it

I described the app to PartyRock, which generated a starting layout. I then edited each widget's prompt and connected them to my notes so every answer draws on the same source.

The welcome message

To make NoteMates feel like a study buddy, I wrote a welcome message that explains how to start and sets expectations about how it answers.

"Hey there, welcome to NoteMates! Your notes and you make the perfect study pair. Upload your notes and I'll help you find answers, test yourself with practice questions, and review key terms. Ready when you are!"

I kept it short and friendly, and included the promise to say so when an answer isn't in the notes, so the responsible AI behavior is visible to users from the start.

Prompts I used

- **Study chatbot:**

  "You are NoteMates, a friendly study buddy for students preparing for the AWS Cloud Practitioner exam. Answer questions using the information in @Study Notes. Keep answers short and clear, and use simple language. If the answer is not in the notes, say "I can't find that in your notes" and suggest what to add, rather than guessing."

- **Quiz generator:**

  "Create 5 multiple-choice questions in the style of the AWS Cloud Practitioner exam. Give four options (A-D) for each, mark the correct answer, and add a one-sentence explanation based on the notes."

- **Flashcards:**

  "Allow the user to select a Topic and list the 10 most important terms. For each, give the term and a one-sentence definition in plain language, taken from the notes."

- **Topic summary:**

  "Create a Topic summary section from @Study Notes if study notes are uploaded into 5-7 key points a student could review in two minutes. Use short bullet points and bold the key AWS service names. Alternatively, allow the user to select a topic from a dropdown list."

Generated Quiz, Flashcard and Topic Summary

Not working as expected

1. The *Study Notes* widgets only allows an upload of a document and not free text and the upload feature does not work for all document types.
2. There is a character limit for study notes the student can upload and usually when making notes you are not counting characters.
3. The application would not do anything after selections are made unless study notes were uploaded. When there are no study notes uploaded, the app is meant to use official AWS Documentation for the answers.
4. The *Generated Quiz* does not allow for answer selection it lists the question and answer, meaning you see the answer before you are able to work through the question.
5. The *Generated Quiz* is a long list of text and does not allow for answer selection.

Improvements

1. Make uploading study notes optional.
2. I need a more robust welcome message to the app, it does not seem friendly enough.
3. The difficulty mode selection options are ***Foundational***, ***Associate***, and ***Professional*** which is more working-professional focused. This needs to be amended to ***Beginner***, ***Intermediate***, and ***Exam-focused*** because this is aimed at students working towards their professional careers.
4. Include Headings (if possible) to separate the different sections of the app.
5. The content source needs to be generated from the students Study Notes, AWS Documentation or both. The student should be able to make this selection.
6. The *Generated Quiz* is a long list of text and should allow for answer selection and only show one question at a time and only move onto the next question once a selection is made.
7. The *Generated Quiz* should give a score after each completed quiz with a “Pass” or “Fail” message. 80% of the questions need to be answered correctly to receive a “Pass”. The score should be displayed regardless of “Pass” or “Fail” and should be calculated as [Score = (Number of correct answers / Total number of questions) * 100].
8. The Flashcards are limited to 10 and I would like to make this 20.
9. The Generated Quiz is only 5 multiple choice questions and I would like this to be 10.
